Assembly Instruction

1. Tool installation:
   1. Insert the lever into the hole.
   2. Fixing it with the screw.

2. Connector assembly steps:
   A) Open lever.
   B) Insert already soldered connector.
   C) Place boot into the fixture.
   D) Press connector and boot together by lifting the lever.

Modification of the pre-adjustment may be necessary because of cable diameter or usage of the XXCR clear coding ring with the XX Series.

Note:
“Speed boot” of XLR connectors may damage the XLR boot thread.
It’s usually not possible to re-open the boot without a tool after assembly.
