opticalCON breakout cable - one end opticalCON cable connector, other side LC, SC, ST or FC connectors.

With the opticalCON QUAD we have a different situation compared with the opticalCON DUO. QUAD breakout cables can be used as measurement cables which can be handy to ease fiber optic measurement work, especially on installations with no access to the rear of the chassis connector since the opticalCON QUAD chassis is not compatible with LC in the front. Other possible applications for breakout cables would be equipment or darkfiber installations.

Part number finder:

.

opticalCON breakout cables are not a very rugged solution - we always recommend to use an opticalCON cable connector on both cable ends, as shown in this example:

.
